Ask RadiationGPT
what is radiation
Radiation is a broad term that encompasses various forms of energy emitted by atoms or subatomic particles. It is the result of the spontaneous emission of energy from unstable atomic nuclei, a process known as radioactivity. Radiation can be broadly categorized into several types based on their properties and the particles that carry them.
1. Ionizing Radiation: This type of radiation has enough energy to remove tightly bound electrons from atoms, resulting in the formation of ions. Examples include:
