🚀 **Excited to share my new AI project – RadiationGPT** ☢️

I'm happy to announce that I have developed **RadiationGPT**, an AI assistant designed for **Nuclear Physics and Radiation Measurement**. This project combines **Artificial Intelligence with Radiation Science** to help understand nuclear physics concepts and perform radiation calculations.

🔬 **Key Features of RadiationGPT:**

• AI Chat Assistant for Nuclear Physics questions
• Detector Knowledge Module (NaI(Tl), HPGe, GM Counter, ZnS detectors)
• Minimum Detectable Activity (MDA) Calculator
• Activity Calculation Tool
• Radioactive Decay Correction Calculator
• Interactive AI-powered dashboard

🧠 **Technologies Used:**

• Python
• Streamlit for interactive web interface
• Groq API with Llama AI model for fast responses
• Sentence Transformers for semantic understanding
• FAISS for vector-based knowledge retrieval

This project demonstrates how **AI can assist in radiation measurement, nuclear instrumentation, and scientific learning**.

As someone working in the **radiation measurement field**, I'm interested in exploring how **AI can improve nuclear data analysis and radiation safety applications**.

I will continue improving this project with more features such as **gamma spectrum analysis and radionuclide identification**.

I would love to hear your thoughts and feedback!
